

[Insert title of invention]On-cue hot-water circulator

Abstract

The current invention is an on-cue hot-water circulator. This device and method consists of an electronic control module, a manifold containing a check valve and/or a normally closed solenoid valve, a flow switch, and a high-performance pump (not a typical circulation pump), that is also designed or selected for its ability to allow water to pass through it with little or no restriction, when not operating.
